“During the 21st century work is creeping into our domestic lives. I propose that they should be separated spatially and programmatically using indoor, outdoor formal interventions in order to increase overall human productivity.”

“The option to live and work closer together has increased in popularity for the sustainability of relationships and communities with the city still being the prime place for access to opportunities and services.”

“The masterplan proposes to attract vulnerable people from economically deprived areas of the inner city and provide them with services to care for them and re-skill them in order to redistribute them around the city as more independent and stronger members of society.”

“By enhancing the architectural experience of the rehabilitation centre, with nature and technology, I can make programmatic and spatial separations in a more unconventional and uninstitutional way, increasing rehabilitation performance.”
